PACKAGING Equipment and Supplies

MG America

Corporate Description

MG America, a subsidiary of MG 2 (Bologna, Italy), is a recognized leader in the supply of processing and packaging machinery to the pharmaceutical, nutritional, cosmetic, food, and general packaging industries throughout the United States, Canada, and Puerto Rico.

Facilities

MG America is headquartered in Fairfield, NJ where its in-house staff provides sales, field service, spare parts, machine trials, and a clean room for testing customers' products on MG2 capsule fillers.

Products and Services

MG2 Packaging/Assembly Machinery: Through MG2's Packaging Division, MG America offers equipment designed for flexibility, compact operation, ease of use and maximum reliability. Equipment includes casepackers, cartoners, thermoforming machines, blister packaging machines, sachet machinery, palletizers, tray formers, syringe assembly equipment, inspection systems, and sterile/aseptic filling machinery.

MG2 Capsule Filling Machinery: Through the Processing Division of parent company MG2, MG America offers a complete selection of capsule fillers with speeds ranging from 6,000 to 200,000 capsules per hour. Dosage forms

that can be filled include powders, pellets (beads), tablets, and liquids. Capsules can be filled either as a single dose, multiple dose, or in combination with other dosage forms. MG America also offers several innovative weight control systems.

Featured Equipment

MG America offers the AlterNova Capsule Filler, which is specially designed to be flexible so that growing companies can easily increase production or change product forms and sizes. The AlterNova is the only intermittent motion capsule filler with a basic output of 105,000 capsules per hour that can be efficiently upgraded to speeds up to 180,000 capsules per hour. The machine can dose any oral pharmaceutical form—solid or liquid—and can combine up to four different kinds of products into the same capsule.

MG America also offers the FlexaLAB Capsule Filler designed for R&D laboratories, clinical trials, small batch outputs and special productions. The portable machine can produce up to 3000 caps/hour, in various sizes, and can operate either in continuous or intermittent motion. The FlexaLAB is able to make capsules that combine various products for maximum R&D flexibility.
