

M102 - Modeling with Linear Functions

Badge Specific Essential Concepts

- ❖ Create a situation to correspond to a given linear model
- ❖ Create a linear equation to model the situation and precisely define the variables they are using
- ❖ Create an appropriate scale on a graph to correspond to a situation
- ❖ Identify and interpret the x- and y-intercepts

Administration Notes

This Pre-Post Badge Task is to be used as a tool for students to understand their learning. When administering this task, it is important to highlight a few things for students:

- Students will have the opportunity to complete the task at the beginning and the end of this badge. This is because we want students to be able to see how much they've learned and reflect on that learning in ways that matter to them.
- The work on the task will not be graded. The task is not a quiz or a test - it is designed to support students in understanding how much they have learned from the beginning of the badge to the end.
- Students can have access to any technology that they typically use during classroom instruction to complete this task.
- Students should work individually on the task.

Please share these things with students, reinforcing the idea that this task has been designed to support them in reflecting on the mathematics they have learned. In some tasks, students may create work in different places. It is helpful for them to have their own online folders to store their pre-post tasks as well as any supporting artifacts, such as screenshots from online tools that they use.

Task Analysis

The purpose of the task analysis section is to report on student performance at the two time points -- how they performed on each question within the task before and after badge instruction. Complete a table for each student based on an analysis of their responses. You can create summary data for yourself if you choose to understand more globally how students are doing on the concepts measured by the task.

PRE

Were there any interesting or instructionally useful responses or insights from the student? Please record those here:

Question/Look For	Blank or similar	Emerging	Approaching	Meeting	Other Notes
2a. Student creates a real world situation to match the graph.					
2b. Student precisely defines the variable.					
2c. Student labels the graph and provides an appropriate scale.					
3a. Student identifies and interprets the x-intercept.					
3b. Student identifies and interprets the y-intercept.					
4. Student creates an equation to represent the relationship between variables.					
5. Student identifies one other point on the line and explains its meaning in the context of the problem.
